

THE STACK INVERTS. THE HOME IS THE UNCLAIMED END.

At WWDC 2026, Apple demoted apps from destinations to capabilities an OS-level agent invokes. Computing is moving from clicks ("open the plumber app") to goals ("fix my leak"). Transport between agents is two APIs and a schema; it trends to zero, and Apple just industrialized it. What survives splits in two: interchangeable supply gets auctioned by the OS — Siri can route a fare to Uber or Lyft indifferently, so margin moves to the aggregator — while exclusive ground truth gets called on its own terms. Value drains from the middle of the stack and pools at the ends.

The home is the exclusive end. Give any horizontal agent the same sentence — "my water heater is leaking" — and Siri, ChatGPT, and Gemini fail identically: each can find a plumber; none can know the unit is a 2019 Rheem, that the last valve repair ran \$300, or that knob-and-tube wiring sits behind the wet drywall. The home is the largest undigitized environment on earth and it has no API; a better model cannot see through a wall. Unlike rides, the record cannot be crawled or multi-homed — there is exactly one consented record of a given house. Jackknife is building it: homeowner-originated, property-attributed, outcome-labeled.

A first buyer compelled by law. Post-NAIC, states now bar aerial imagery as the sole basis for adverse underwriting action and require current corroboration when a homeowner disputes it. The most predictive signals — water-heater age (non-weather water: ~24% of homeowner claims, ~\$12.5K average severity), recalled electrical panels — are interior, precisely where aerial is blind. A consented, time-stamped record is the compliant second source. We facilitate evidence that may support better rates; we never determine coverage or guarantee savings.

The moat is alignment — and we name the hazard first. Marketplaces resell your inquiry; hardware locks you in; insurtech prices your data against you. Only an entity with no OS, no ads, no hardware, and no risk book can promise the record never leaves without the homeowner's permission — none of the Big Four can copy that without contradicting their own model. And the trust-platform hazard — the rated party pays — applies to us too: contractors buy introductions, never a position in the record. The record stays homeowner-owned either way.

Where we are. ~100 homes in Essex County, MA. Corroboration scaffolding — timestamps, geotags, licensed-contractor sign-off — ships first, because it is the product. A Massachusetts carrier backtest is the near-term proof. Density before breadth: standards ratify incumbents, and attestation is the North Star, not a badge we claim today.

The internet built its counterparty-trust institution over two decades. The agentic economy requires the same institution for the asset itself. Both ends of the home stack are unclaimed.
