

The trust fabric for the agentic home economy.

Why Jackknife is the verification layer for home data — and where it clicks into Trustpilot's world.

Trustpilot verifies the **counterparty.
Jackknife verifies the **asset**.**

**In an agent-to-agent economy,
you can't transact without both —
and almost nobody is building the asset side.**

In an A2A economy, the bottleneck isn't intelligence. It's trusted data.

Models are cheap and getting cheaper. The entire risk surface of autonomous transactions is one question: **“Can I trust this input?”**

Whoever owns a verified data layer owns a toll booth in the agentic economy. Trustpilot already lives this — “trust as infrastructure” is the franchise.

What Trustpilot verifies

Who you're dealing with. Is this business reputable? One axis.

What's still wide open

What's actually true about the thing being transacted. For the home, that axis is Jackknife.

Every home-services transaction needs both sides to be machine-verifiable.

COUNTERPARTY TRUST

★ **Trustpilot**

“Is this contractor / business legit?”

Solved. A 15-year franchise built on reputation signals about companies.

ASSET TRUST

OPEN / UNBUILT

Jackknife

“What’s actually in this home — make, age, condition, warranty, recall status?”

Greenfield. The home is the largest, least-digitized consumer asset class.

Three properties turn data from self-reported into **attested**.

01 · PROVENANCE

Evidence-grounded capture

Starts from a photo, not a typed claim. Timestamped, hard to fake — an attestation, not an assertion.

02 · RECONCILED

Cross-referenced to ground truth

Make/model resolved against manufacturer specs, warranty terms, and the federal CPSC recall database.

03 · ACCEPTED

Records third parties act on

Insurance-claim export already produces documentation insurers accept. The literal definition of a verification layer.

THE ANALOGY FOR THE ROOM

THE ANALOGY FOR THE ROOM

Carfax, for the home.

A trusted record that buyers, sellers, insurers — and increasingly, agents — query before they transact. Far larger asset class. Far less digitized.

“Stop managing your most important asset with a junk drawer and a prayer.”

Jackknife sits **upstream** of Trustpilot's oldest problem: review authenticity.

TRUSTPILOT'S GAP

Unverified, gameable prose

Reviews are self-reported and hard to authenticate — and in an agentic world, prose agents don't want to parse anyway.

!

JACKKNIFE'S BYPRODUCT

Verified transactions

Tracks every repair diagnosis! completion: real job, real outcome, on a real asset. The highest-grade trust signal in home services.

!

THE FIT

Complementary, not competitive

JK supplies verified-outcome signals; Trustpilot is the reputation oracle JK's matching layer consumes. Each fills the other's blind spot.

Three questions to put to the board.

- 1 As agents start transacting, does Trustpilot's product evolve from human-readable reviews toward machine-consumable trust primitives — and what's the unit of trust in that world?
- 2 Trustpilot verifies the counterparty. Who verifies the asset? Have they thought about the demand-side of the trust fabric at all?
- 3 Would a stream of verified-completion signals be valuable to them — and is that a partnership or a build-vs-buy question?

WALK IN WITH THIS

Trust is a two-sided fabric.
You own the counterparty side.
The asset side is unbuilt.
The agentic economy makes both
mandatory.

That positions Jackknife as adjacent infrastructure to Trustpilot — not a downstream app.
A much stronger seat at the table.

Jackknife — the verification layer of home data.
